Groups And Computation:

Groups and Computation Larry Finkelstein, William M. Kantor, 1993-01-01 This volume contains papers presented at the Workshop on Groups and Computation held in October 1991 The workshop explored interactions among four areas symbolic algebra and computer algebra theoretical computer science group theory and applications of group computation The relationships between implementation and complexity form a recurrent theme though the papers also discuss such topics as parallel algorithms for groups computation in associative algebras asymptotic behavior of permutation groups the study of finite groups using infinite reflection groups combinatorial searching computing with representations and Cayley graphs as models for interconnection networks

Groups and Computation II. Larry Finkelstein, 1997 The workshop Groups and Computations took place at the Center for Discrete Mathematics and Theoretical Computer Science DIMACS at Rutgers University in June 1995 This and an earlier workshop see Groups and Computation Finkelstein and Kantor 1993 American Mathematical Society held in October 1991 was aimed at merging theory and practice within the broad area of computation with groups The primary goal of the previous workshop was to foster a dialogue between researchers studying the computational complexity of group algorithms and those engaged in the development of practical software

Handbook of Computational Group Theory Derek F. Holt, Bettina Eick, Eamonn A. O'Brien, 2005-01-13 The origins of computation group theory CGT date back to the late 19th and early 20th centuries Since then the field has flourished particularly during the past 30 to 40 years and today it remains a lively and active branch of mathematics The Handbook of Computational Group Theory offers the first complete treatment of all the fundame

Group Theory and Computation N.S. Narasimha Sastry, Manoj Kumar Yadav, 2018-09-21 This book is a blend of recent developments in theoretical and computational aspects of group theory It presents the state of the art research topics in different aspects of group theory namely character theory representation theory integral group rings the Monster simple group computational algorithms and methods on finite groups finite loops periodic groups Camina groups and generalizations automorphisms and non abelian tensor product of groups Presenting a collection of invited articles by some of the leading and highly active researchers in the theory of finite groups and their representations and the Monster group with a focus on computational aspects this book is of particular interest to researchers in the area of group theory and related fields of mathematics

Groups and Computation III William M. Kantor, Ákos Seress, 2001-01-01 This volume contains contributions by the participants of the conference Groups and Computation which took place at The Ohio State University in Columbus Ohio in June 1999 This conference was the successor of two workshops on Groups and Computation held at DIMACS in 1991 and 1995 There are papers on permutation group algorithms finitely presented groups polycyclic groups and parallel computation providing a representative sample of the breadth of Computational Group Theory On the other hand more than one third of the papers deal with computations in matrix groups giving an in depth treatment of the currently most active area of the field The points of view of the papers range from explicit computations to group theoretic algorithms to group theoretic theorems needed for algorithm development

Groups, Languages and Automata Derek F. Holt, Sarah Rees, Claas E. Röver, 2017-02-23 Fascinating connections exist between group theory and automata theory and a wide variety of them are discussed in this text Automata can be used in group theory to encode complexity to represent aspects of underlying geometry on a space on which a group acts and to provide efficient algorithms for practical computation There are also many applications in geometric group theory The authors provide background material in each of these related areas as well as exploring the connections along a number of strands that lead to the forefront of current research in geometric group theory Examples studied in detail include hyperbolic groups Euclidean groups braid groups Coxeter groups Artin groups and automata groups such as the Grigorchuk group This book will be a convenient reference point for established mathematicians who need to understand background material for applications and can serve as a textbook for research students in geometric group theory

Computational Group Theory and the Theory of Groups Luise-Charlotte Kappe, Arturo Magidin, Robert Fitzgerald Morse, 2008 The power of general purpose computational algebra systems running on personal computers has increased rapidly in recent years For mathematicians doing research in group theory this means a growing set of sophisticated computational tools are now available for their use in developing new theoretical results This volume consists of contributions by researchers invited to the AMS Special Session on Computational Group Theory held in March 2007 The main focus of the session was on the application of Computational Group Theory CGT to a wide range of theoretical aspects of group theory The articles in this volume provide a variety of examples of how these computer systems helped to solve interesting theoretical problems within the discipline such as constructions of finite simple groups classification of p groups via coclass representation theory and constructions involving free nilpotent groups The volume also includes an article by R F Morse highlighting applications of CGT in group theory and two survey articles Graduate students and researchers interested in various aspects of group theory will find many examples of Computational Group Theory helping research and will recognize it as yet another tool at their disposal

Probabilistic Group Theory, Combinatorics, and Computing Alla Detinko, Dane Flannery, Eamonn O'Brien, 2013-01-13

Probabilistic Group Theory Combinatorics and Computing is based on lecture courses held at the Fifth de Br n Workshop in Galway Ireland in April 2011 Each course discusses computational and algorithmic aspects that have recently emerged at the interface of group theory and combinatorics with a strong focus on probabilistic methods and results The courses served as a forum for devising new strategic approaches and for discussing the main open problems to be solved in the further development of each area The book represents a valuable resource for advanced lecture courses Researchers at all levels are introduced to the main methods and the state of the art leading up to the very latest developments One primary aim of the book's approach and design is to enable postgraduate students to make immediate use of the material presented

Permutation Group Algorithms Ákos Seress, 2003-03-17 Permutation group algorithms are one of the workhorses of symbolic algebra systems computing with groups They played an indispensable role in the proof of many deep results including the construction and study of sporadic finite simple groups This book describes the theory behind permutation group algorithms including developments based on the classification of finite simple groups Rigorous complexity estimates implementation hints and advanced exercises are included throughout The central theme is the description of nearly linear time algorithms which are extremely fast both in terms of asymptotic analysis and of practical running time A significant part of the permutation group library of the computational group algebra system GAP is based on nearly linear time algorithms The book fills a significant gap in the symbolic computation literature It is recommended for everyone interested in using computers in group theory and is suitable for advanced graduate courses
