Soft Computing for Problem Solving Kedar Nath Das,Jagdish Chand Bansal,Kusum Deep,Atulya K. Nagar,Ponnambalam Pathipooranam,Rani Chinnappa Naidu,2019-11-27 This two volume book presents the outcomes of the 8th International Conference on Soft Computing for Problem Solving SocProS 2018 This conference was a joint technical collaboration between the Soft Computing Research Society Liverpool Hope University UK and Vellore Institute of Technology India and brought together researchers engineers and practitioners to discuss thought provoking developments and challenges in order to select potential future directions The book highlights the latest advances and innovations in the interdisciplinary areas of soft computing including original research papers on algorithms artificial immune systems artificial neural networks genetic algorithms genetic programming and particle swarm optimization and applications control systems data mining and clustering finance weather forecasting game theory business and forecasting applications It offers a valuable resource for both young and experienced researchers dealing with complex and intricate real world problems that are difficult to solve using traditional methods

Solving Direct and Inverse Heat Conduction Problems Jan Taler,Piotr Duda,2010-04-16 This book is devoted to the concept of simple and inverse heat conduction problems The process of solving direct problems is based on the temperature determination when initial and boundary conditions are known while the solving of inverse problems is based on the search for boundary conditions when temperature properties are known provided that temperature is the function of time at the selected inner points of a body In the first part of the book Chaps 1 5 we have discussed theoretical basis for thermal conduction in solids motionless liquids and liquids that move in time In the second part of the book Chapters 6 26 we have discussed at great length different engineering problems which

we have presented together with the proposed solutions in the form of theoretical and mathematical examples. It was our intention to acquaint the reader in a step by step fashion with all the mathematical derivations and solutions to some of the more significant transient and steady state heat conduction problems with respect to both the movable and immovable heat sources and the phenomena of melting and freezing. Lots of attention was paid to non linear problems. The methods for solving heat conduction problems i.e. the exact and approximate analytical methods and numerical methods such as the finite difference method, the finite volume method, the finite element method and the boundary element method are discussed in great detail. Aside from algorithms, applicable computational programs written in a FORTRAN language were given.

Problem Solving for Process Operators and Specialists Joseph M. Bonem, 2011-04-18. This book provides methods to train process operators to solve challenging problems. The book is split into two parts. The first part consists of two parts: first developing a daily monitoring system and second providing a structured 5 step problem solving approach that combines cause and effect problem solving thinking with the formulation of theoretically correct hypotheses. The 5 step approach emphasizes the classical problem solving approach: defining the sequence of events with the addition of the steps of formulating a theoretically correct working hypothesis, providing a means to test the hypothesis and providing a foolproof means to eliminate the problem. The initial part of the book focuses on defining the problem that must be solved and obtaining the location, time and quantity based specifications of the problem. This part of the book also presents techniques to find and define problems at an early point before they progress to the critical level. The second part of the book deals with the utilization of fundamental chemical engineering skills to develop a technically correct working hypothesis that is the key to successful problem solving. The primary emphasis is on simple pragmatic calculation techniques that are theoretically correct. It is believed that any operator can perform these calculations if he is provided the correct prototype. Throughout the book the theory behind each pragmatic calculation technique is explained in understandable terms prior to presenting the author's approach. These techniques have been developed by the author in 50 years of industrial experience. The book includes many sample problems and examples of real world problem solving. Using these techniques, theoretically correct working hypotheses can be developed in an expedient fashion.

Solving Problems in Thermal Engineering Viktor Józsa, Róbert Kovács, 2019-10-24. This book provides general guidelines for solving thermal problems in the fields of engineering and natural sciences. Written for a wide audience from beginner to senior engineers and physicists, it provides a comprehensive framework covering theory and practice and including numerous fundamental and real world examples. Based on the thermodynamics of various material laws, it focuses on the mathematical structure of the continuum models and their experimental validation. In addition to several examples in renewable energy, it also presents thermal processes in space and summarizes size dependent non-Fourier and non-Fickian problems which have increasing practical relevance in e.g. the semiconductor industry. Lastly, the book discusses the key aspects of numerical methods, particularly highlighting the role of

boundary conditions in the modeling process The book provides readers with a comprehensive toolbox addressing a wide variety of topics in thermal modeling from constructing material laws to designing advanced power plants and engineering systems
