Jack D. Wood, 2011 Moreover our incomplete understanding of the pathobiology of these disorders highlights a need for research directed to expansion of current knowledge of the neurobiology of the ENS at all levels of organization from the cellular biology of individual neurons to the biophysics of integrated networks to whole organ behavior Investigation of the normal and disordered ENS and its interactions with the central nervous system is a branch of neurogastroenterology Neurogastroenterology is a scientific and clinical subspecialty of gastroenterology that deals with the neural mechanisms that influence function of the digestive tract and that underlie projection of conscious sensations to the gut

The Enteric Nervous System II Nick J. Spencer, Marcello Costa, Stuart M. Brierley, 2023-01-01 This book is based on the proceedings of the Enteric Nervous System conference in Adelaide Australia under the auspices of the International Federation for Neurogastroenterology and Motility The book focuses on methodological strategies and unresolved issues in the field and explores where the future is heading and what technological advances have been made to address current and future questions The Enteric Nervous System II continues in the tradition of a popular earlier volume which covered the previous meeting Many of the same authors are contributing to this new volume presenting state of the art updates on the many developments in the field since the earlier meeting The coverage includes a wide range of topics from structure and function of the enteric nervous system through gut motility and visceral pain The author team includes long established authorities who significantly contributed to the advances in ENS research over the past two decades and the new generation that will continue to contribute to advancing our understanding of the field

**The Integrative Action of the Autonomic Nervous System** Wilfrid Jänig, 2022-08-04 Almost all bodily functions are dependent on activity of the autonomic nervous system from the cardiovascular system the gastrointestinal tract the evacuative and sexual organs to the regulation of temperature metabolism and tissue defence Balanced functioning of each aspect of this system is an important basis of our life and well

being In this long awaited second edition the author a leading figure in this field provides an up to date and detailed description of the cellular and integrative organization of the autonomic nervous system covering both peripheral and central aspects The book exposes modern neurobiological concepts that allow us to understand why this system normally runs so smoothly and why its deterioration has such disastrous consequences This broad overview will appeal to researchers and advanced undergraduate students of the various biological and medical sciences studying how the autonomic nervous system works and to clinicians and physical therapists whose practice involves systems dependent on autonomic functions *The Autonomic Nervous System* Albert Kuntz,1929

**Quick Reference Neuroscience for Rehabilitation Professionals** Sharon A. Gutman,2008 Addresses the information needed to understand the neuroscience of clinical rehabilitation This book describes basic neuroanatomical structures and functions neuropathology underlying specific clinical conditions and theories supporting clinical treatment

**The Paraneuron** Tsuneo Fujita,Tomio Kanno,Shigeru Kobayashi,2012-12-06 The regulation of the organism has traditionally been ascribed to two distinct systems the nervous and the endocrine Though coordination between the two systems has been acknowledged researchers and authors have tended to deal with them as comprising separate categories of cells involved in different activities With this approach a given regulatory mechanism would be evaluated as to whether it should be accounted for by nervous or endocrine functions The past 15 years however have witnessed numerous important discoveries and conceptual developments concerning the morphological physiological and bio chemical relations between the nervous and endocrine systems Advances in immunocytochemical studies have revealed that there are a wide variety of messenger substances that function in both regulatory systems As a result researchers have been stimulated to investigate neuronlike properties of endocrine cells and conversely endocrine or secretory features of neurons It has thus become obvious that the rigidities in the classic criteria of neurotransmitters and hormones may rather impede further advances in these research fields The activities of neurons are no longer evaluated simply in terms of EPSP IPSP and the release of classic transmitters such as acetylcholine noradrenaline and GABA Hormonal actions are no longer analyzed solely with regard to concentrations of classic aminic and peptidic hormones in the systemic blood circulation The concept of the paraneuron which we proposed in 1975 has become one of the theoretical bases for the development of this trend of study
