Solid-state Lasers Thomas O. Hardwell, 2008 A solid state laser use and gain medium that is a solid rather than a liquid such as dye lasers or a gas such as gas lasers Semiconductor based lasers are also in the solid state but are generally considered separately from solid state lasers Generally the active medium of a solid state laser consists of a glass or crystalline host material to which is added a dopant such as neodymium chromium erbium or other ions Many of the common dopants are rare earth elements because the excited states of such ions are not strongly coupled with thermal vibrations of the crystalline lattice phonons and the lasing threshold can be reached at relatively low brightness of pump There are many hundreds of solid state media in which laser action has been achieved but relatively few types are in widespread use Of these probably the most common type is neodymium doped YAG Neodymium doped glass Nd glass and Ytterbium doped glasses and ceramics are used in solid state lasers at extremely high power terawatt scale high energy megajoules multiple beam systems for inertial confinement fusion Titanium doped sapphire is also widely used for its broad tunability This book gathers new research in the field

Microfluidics in Biotechnology Janina Bahnemann, Alexander Grünberger, 2022-07-28 This new volume introduces the applications of microfluidic systems to facilitate biotechnological and biomedical processes It provides an overview on cutting edge technologies summarizes traditional and modern fabrication methods and highlights recent advances regarding the application of lab on a chip LoC systems for bioanalytical purposes This book is ideal for research scientists and students interested at the cross section between biotechnology chemistry and chemical engineering
