Yaramasu, Bin Wu, 2016-11-23 *Model Predictive Control of Wind Energy Conversion Systems* addresses the predictive control strategy that has emerged as a promising digital control tool within the field of power electronics variable speed motor drives and energy conversion systems. The authors provide a comprehensive analysis on the model predictive control of power converters employed in a wide variety of variable speed wind energy conversion systems WECS. The contents of this book include an overview of wind energy system configurations, power converters for variable speed WECS, digital control techniques, MPC modeling of power converters and wind generators for MPC design. Other topics include the mapping of continuous time models to discrete time models by various exact, approximate, and quasi-exact discretization methods; modeling and control of wind turbine grid-side two-level and multilevel voltage source converters. The authors also focus on the MPC of several power converter configurations for full variable speed permanent magnet synchronous generator based WECS, squirrel-cage induction generator based WECS, and semi-variable speed doubly fed induction generator based WECS. Furthermore, this book analyzes a wide variety of practical WECS, illustrating important concepts with case studies, simulations, and experimental results. It provides a step-by-step design procedure for the development of predictive control schemes for various WECS configurations, describes continuous and discrete time modeling of wind generators and power converters, weighting factor selection, discretization methods, and extrapolation techniques. It presents useful material for other power electronic applications such as variable speed motor drives, power quality conditioners, electric vehicles, photovoltaic energy systems, distributed generation, and high voltage direct current transmission. It explores S-Function Builder programming in the MATLAB environment to implement various MPC strategies through the companion website. Reflecting the latest technologies in the field, *Model Predictive Control of Wind Energy Conversion Systems* is a valuable reference for academic researchers, practicing engineers, and other professionals. It can also be used as a textbook for graduate-level and advanced undergraduate courses.

IEEE Instrumentation and Measurement Technology Conference ,1997 **Control of Power Converter for Grid Integration of Renewable Energy Conversion and STATCOM Systems** Ling Xu,2009 Investment in renewable energy is rapidly increasing worldwide This is in response to a number of global challenges and concerns including climate change increasing energy demand and energy security The investment is widely spread over the leading renewable energy technology sectors wind solar biofuels biomass and fuel cells Among those wind solar photovoltaic and fuel cells require power electronic converters for grid integration This thesis investigates advanced control technology for grid integration control of renewable energy sources and STATCOM systems First the conventional control mechanism of power converters applied in renewable energy conversion and STATCOM systems is studied Through both theoretical and simulation studies a

deficiency of the conventional control mechanism is identified. It is found that malfunctions of traditional power converter control techniques may occur when the controller output voltage exceeds the converter linear modulation limit. Then the thesis proposes a novel control mechanism consisting of a current control loop and a voltage control loop. The proposed control mechanism integrates PID adaptive and fuzzy control techniques. An optimal control strategy is developed to ensure effective active power delivery and to improve system stability. The behaviors of conventional and proposed control techniques are compared and evaluated on both simulation and laboratory hardware testing systems, which demonstrates that the proposed control mechanism is effective for grid integration control over a wide range of system operating conditions, while the conventional control mechanism may behave improperly, especially when the converter operates beyond its linear modulation limit and under variable system conditions.
