Essay Example on Understanding Interest Rates in Financial Borrowing/Lending Essay

Introduction

In financial businesses, interest rates apply mostly to borrowing or lending transactions. Individuals take loans to fund projects, purchase homes, fund or launch businesses, or pay the school fees. Business entities borrow loans to open and expand their operations through purchasing long-term and fixed assets including buildings, land, and machines. Usually, borrowed money is repaid either in the periodic installments or a lump sum within a pre-determined date. Financial institutions often charge interest rates on the loans to make profit and expand their operational processes. The interest rates are the cost of liability to the principal or the amount of money borrowed from financial institutions such as banks. In other words, interest rates are the rate of return for the lender. Both simple and compound interest approaches are used to determine the cost of debt to the borrower.

Simple Interest

Simple interest is a simple and quicker way of determining the interests charged on the borrowed assets or money. The calculation usually involves multiplying the daily interest rates by the principal or the loan borrowed and the number of days that elapse between the payment periods. When a borrower makes payment in a simple interest loan, initially, the payment is directed towards that month's interest, and the rest goes towards the principal. In most cases, the interest rate for each month is paid in full so that it never accrues (Steiner, 2012). Compound interest, on the other hand, adds some of the monthly interests onto the borrowed amount. In other words, the borrower ought to pay new interests in the old interest. Simple interest only applies to short term loans, even though some mortgages may use the same calculation (Steiner, 2012). The formula for determining simple interest on loans is given as:

Simple Interest = Principal Time Rate

$$SI = P T R$$

Where the rate is expressed as a percentage (Steiner, 2012)

Simple interest is calculated daily and this makes it beneficial to the consumers who pay borrowed money on time, at least early each month. The payment of loans early each month makes the principal balance to shrink faster, the borrowers can then pay the loan sooner than the original estimate. Contrariwise, if an individual pays the loan late or past the deadline, more of their payments usually go towards interest. The ethical concerns arising from the calculation of the simple interest include extra charges that one has to accrue in case there is late repayment (Steiner, 2012). Also, with the early repayment time, consumers or borrowers have high chances of benefiting from the loan.

Essays on the Term Structure of Interest Rates Nisha Aroskar,2003 Abstract This dissertation contributes to the study of the term structure of interest rates by addressing some of the gaps in this literature The term structure is an important channel of monetary transmission It also contains information about the intertemporal choices made by economic agents The expectations Hypothesis is the primary explanation in economics that links short term interest rates to long term interest rates In the first essay I extend the literature by examining the expectations hypothesis in the newly developed financial markets I find that the expectations theory is not rejected in these markets This evidence is in sharp contrast to the evidence earlier presented for industrialized countries Further contrary to the simple expectations theory the term premium has high persistence which is reflected in significantly autoregressive error terms The evidence also supports the longstanding suggestion that the term premium could be related to the liquidity in the economy The next essay investigates the forecasting ability of the term spread for future output growth There appears to be a sharp decline in the predictive power of the term spread in countries that have adopted monetary policy with a stronger response to inflation To explore the underlying economic reasons for these findings I explicitly model the information content of the term spread for future output growth based on a structural model Model calibrations suggest that the forecasting ability of the term spread changes with a change in the persistence and the variance of the underlying economic shocks and in the monetary policy preferences The last essay focuses on the term structure as a link between short term and long term interest rates in macroeconomic models I integrate the New Keynesian model and the model of the term structure based on the Intertemporal Consumption Asset Pricing Model This is a more plausible description of the economy compared to the earlier models In this model output responds to an interest rate that includes a time varying term premium which in turn is associated with economic agents expectations about the future economic variables Empirical results provide
