

Activity: An Introduction

Students demonstrate an understanding of compound probability through simple events based on the probability of the first event occurring by applying the principle of independence. The use of independence when determining the probability of two events occurring simultaneously is demonstrated through the spin of two independently selected spinners. Each spin of the spinners is considered to be a simple event and the probability of the first spin is the probability that the first spinner will stop on either green or blue. The probability of the second spin is the probability that the second spinner will stop on either green or blue. The probability of the first spin and the probability of the second spin are independent events. The probability of the first spin and the probability of the second spin are independent events. The probability of the first spin and the probability of the second spin are independent events.

Students identify the outcomes of the compound probability problem as compound events and list the outcomes of the compound probability problem.
