Functional analysis in modern applied mathematics Ruth F. Curtain,A. J. Pritchard,1977 *Functional Analysis in Modern Applied Mathematics* ,1977-08-24 In this book we study theoretical and practical aspects of computing methods for mathematical modelling of nonlinear systems A number of computing techniques are considered such as methods of operator approximation with any given accuracy operator interpolation techniques including a non Lagrange interpolation methods of system representation subject to constraints associated with concepts of causality memory and stationarity methods of system representation with an accuracy that is the best within a given class of models methods of covariance matrix estimation methods for low rank matrix approximations hybrid methods based on a combination of iterative procedures and best operator approximation andmethods for information compression and filtering under condition that a filter model should satisfy restrictions associated with causality and different types of memory As a result the book represents a blend of new methods in general computational analysis and specific but also generic techniques for study of systems theory ant its particularbranches such as optimal filtering and information compression Best operator approximation Non Lagrange interpolation Generic Karhunen Loeve transform Generalised low rank matrix approximation Optimal data compression Optimal nonlinear filtering Techniques of Functional Analysis for Differential and Integral Equations Paul Sacks,2017-05-16 Techniques of Functional Analysis for Differential and Integral Equations describes a variety of powerful and modern tools from mathematical analysis for graduate study and further research in ordinary differential equations integral equations and partial differential equations Knowledge of these techniques is particularly useful as preparation for graduate courses and PhD research in differential equations and numerical analysis and more specialized topics such as fluid dynamics and control theory Striking a balance between mathematical depth and accessibility proofs involving more technical aspects of measure and integration theory are avoided but clear statements and precise alternative references are given The work provides many examples and exercises drawn from the literature Provides an introduction to mathematical techniques widely used in applied mathematics and needed for advanced research in ordinary and partial differential equations integral equations numerical analysis fluid dynamics and other areas Establishes the advanced background needed for sophisticated literature review and research in differential equations and integral equations Suitable for use as a textbook for a two semester graduate level course for M S and Ph D students in Mathematics and Applied Mathematics
