ABSTRACT

Much current user experience literature in HCI presumes that experience can and should be actively controlled by HCI practitioners and passively received by users. In this paper, we argue, instead, that users are actively involved in constructing their experiences through a process of interpretation. As a consequence, experience is co-constructed between users, designers, and systems. To design for this experience, then, we need to shift HCI design strategies from control of user experience to support for flexible interpretation.

INTRODUCTION

This workshop is one signpost of the growing importance of user experience as a topic in HCI, a topic which is not yet greatly understood. In many cases, user experience is currently being discussed as an attribute of software; Apple's website, for example, defines user experience as "a term that encompasses the visual appearance, interactive behavior, and assistive capabilities of software" [2]. This is similar to the definition proposed in standard HCI textbooks (e.g. [11, 16]). This concept of user experience tends to focus on issues of usability: ensuring that all menus throughout the site behave in the same manner, that color schemes and icons are consistent, and that users are able to find the information and accomplish the tasks they desire. Because by this definition user experience is an attribute of systems themselves, it can and should be directly designed and

controlled by the authors of a system and passively received by users.

While this approach to experience can improve the quality of software, it has difficulty doing justice to the full complexity of actual human lived experience. Rather than experience as something to be poured into passive users, we argue that users *actively and individually* construct meaningful human experiences around technology. They do so through a complex process of interpretation, in which users make sense of the system in the full context of their everyday experience.

We are a group of designers, computer scientists, and social scientists building and assessing systems that support and engage *effective presence*, or complex human experiences with emotional, social, and spiritual dimensions. In this paper, we describe our theoretical approach to experience, explain how it alters standard HCI conceptions of how machines relate to human experience and offer some design strategies to more adequately support active user interpretation.

DEALING WITH COMPLEXITIES OF EXPERIENCE

As Wright & McCarthy [18] argue, HCI theories, categories, and models by necessity abstract from users' lived experiences, often inadvertently losing the details that make them rich, relevant and personally meaningful. They point out, for example, that, while we can speak of and program for an abstract category of frustration, the user's actual lived experience of frustration with a two-timing lover will in many
