

I) Évolution d'un système chimique

La transformation chimique correspond au passage entre un état initial à un état final.

On nomme **réactifs** les espèces chimiques qui **sont consommées** et **produits** les espèces chimiques qui sont formées.

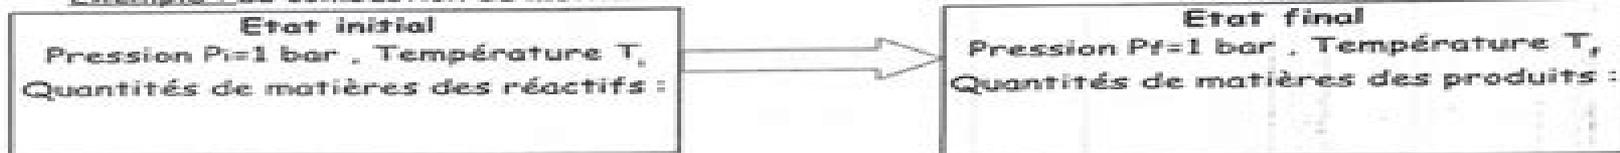

Lorsqu'au moins un des réactifs est entièrement consommé, la réaction s'arrête. Ce réactif s'appelle le réactif limitant.

L'évolution d'un système chimique est modélisée par une réaction chimique.

Certaines espèces ne réagissent pas, au cours d'une réaction chimique : elles sont présentes au niveau des réactifs et des produits. Ce sont des **espèces spectatrices**.

Voir activité expérimentale correspondante.

Exemple : La combustion du méthane :

**II) Équation d'une réaction chimique**

Une réaction chimique est décrite par une **équation chimique**. L'écriture de cette équation fait apparaître la formule brute et l'état physique des réactifs (à gauche de la flèche) et des produits (à droite de la flèche).

Il faut respecter les **lois de conservation** : des éléments chimiques et de la charge de part et d'autre de la flèche.

Les chiffres placés devant chaque espèce chimique dans l'équation s'appellent **nombre stœchiométriques**. Voir activité expérimentale correspondante.

Exemple : Ecrire l'équation de la combustion entre le méthane CH_4 et le dioxygène sachant que les produits sont le dioxyde de carbone et l'eau. (trois gaz et un liquide)

III) Effets thermiques d'une transformation chimique

Les transformations chimiques ou physiques s'accompagnent d'un effet thermique.

S'il y a libération d'énergie, la transformation est **exothermique** (ex : combustions...).

S'il y a absorption d'énergie, la transformation est **endothermique** (ex : voir AE).

IV) Synthèse chimique

On appelle **synthèse** la préparation d'une espèce chimique à partir d'autres espèces chimiques.

On synthétise des espèces chimiques **identiques à des espèces naturelles** pour protéger la nature (en évitant la disparition d'espèces animales et végétales), pour produire en plus grande quantité, pour des raisons économiques. Ex : caoutchouc, acétate de linyle

NB : On synthétise des espèces chimiques artificielles, c'est-à-dire, inventées par l'Homme.

Ex : matières plastiques, nylon.

Voir activité expérimentale correspondante.

Transformations at Land-Water Ecotones, volume II Yizhi Sheng, Xiangfeng Zeng, Linduo Zhao, Yongbin Li, Min Zhang, 2026-02-17 The land water ecotones such as coastal areas wetlands riverine zones and aquifer recharge areas serve as important transition zones fostering intricate biogeochemical processes between terrestrial and aquatic ecosystems These environments harbor unique environmental conditions shaped by the close proximity of land and water bodies Within these ecotones microorganisms bacteria archaea fungi play a pivotal role in driving nutrient biogeochemical cycles and removing contaminants Given the diverse anthropogenic activities intensive and complex exchanges of mass and energy comprehending these biogeochemical processes presents a formidable challenge One of the significant challenges is due to the complex interactions between microbes and the diverse environments they inhabit The functionalities of microbial communities interconnect the exchanges of mass and energy among the biosphere lithosphere hydrosphere atmosphere and anthroposphere in land water ecotones For instance under fluctuating redox conditions the coupling of iron with carbon cycling was largely affected by mineral microbe interaction Electron transfer mass exchange and interactions between minerals and microorganisms are most active in redox transition zones in freshwater estuarine or marine sediments Degraded wetlands play a crucial role in regulating greenhouse gas emissions and mediating carbon and nitrogen loss through regulating microbial activity With the migration of easily mobile organic and inorganic contaminants across ecosystem boundaries due to geogenic and anthropogenic processes the role of microbial communities in degrading or detoxifying the contaminants and their impacts on ecological health becomes vital for environmental protection This Research Topic will therefore present advances in understanding the metabolism distribution and underlying drivers of microbes and their functions in both pristine and contaminated land water ecotones with the aim of improving our understanding of global nutrient biogeochemical cycles contaminant bioremediation microbial environment interaction This Research Topic will include research articles perspectives and reviews focusing on but not limited to the following scopes Microbial driven carbon nitrogen sulfur and metal cycling in nearshore euphotic zone and sediments of coastal and estuarine ecosystems Bioremediation strategies for nitrogen heavy metal petroleum hydrocarbon and emerging contaminants in soil and vadose groundwater ecosystems Mineral microbe interaction and coevolution through geological time and its environmental significance Spatial temporal patterns of bacterial archaeal and fungal community assembly mechanisms and functional potentials at land water ecotones Ecological risk assessment and ecotoxicity of heavy metals in soils sediments and water The Volume I can be checked below <https://www.frontiersin.org/research-topics/59854/microbial-involvement-in-biogeochemical-cycling-and-contaminant-transformations-at-land-water-ecotones>
