Genetic Mechanisms Of Development:

Genetic Mechanisms of Development Frank H. Ruddle, 2013-09-17 Genetic Mechanisms of Development is a compilation of articles that surveys the application of genetic systems of analysis to the resolution of fundamental problems in developmental biology The book is composed of sections that deal with various aspects of genetic mechanisms The first section tackles the genetic analysis of gene regulation in microorganisms The second section discusses the application of Mendelian genetics to the study of the development of Drosophila amphibians and the laboratory mouse The last section introduces somatic cell genetics a tool for developmental biologists Biologists geneticists zoologists and researchers will find the book a good source of information

Molecular Genetic Mechanisms in Development and Aging Morris Rockstein, 2012-12-02 Molecular Genetic Mechanisms in Development and Aging discusses the mechanisms of aging at the level of the genome This book explores the fundamental knowledge concerning the regulation and expression of gene which is derived from investigations on microbial organisms Organized into nine chapters this book starts with an overview of the molecular genetic basis for the processes of aging This text then explores the highly complex multicellular members of the class Insecta which provide the researcher with many distinct and unique advantages for aging studies Other chapters discuss the mechanisms of genetic control and organization during the development and aging of eukaryotes which pose some challenging problems in cellular and developmental biology The final chapter deals with the limitations of previous studies including the lack of comparability due to differences in techniques the measuring of free amino acid titers in hemolymph only and differing diet and environmental variations Biologists and students interested in developmental and molecular genetics will find this book useful

Molecular-Genetic Mechanisms of Sex Determination in Animals Aleksandr F. Smirnov, A. V. Trukhina, Gender sex is a set of morphological and physiological characteristics of the organism underlying sexual reproduction the essence of which is reduced to fertilization i e the fusion of male and female gametes gametes zygote which develops into a new organism Sexual reproduction of a species is considered as one of the mechanisms of its homeostasis Thanks to this mechanism numerous species have an evolutionary advantage In the book two authors will discuss the types of genetic sex determination and differentiation mostly in multicellular animal organisms Sex determination is both genetic and environmental process the sex of an individual being established through an alternative physiological solution There are two main postulated mechanisms of sex determination genetic GSD Genetical Sex Determination and environmental ESD Environmental Sex Determination

Coming To Life Volhard Christiane Nusslein, 2006-04-11 Christiane Nusslein

Volhard winner of The Nobel Prize in Medicine gives a concise and illustrative overview of genetics evolution and cellular processes as well as a discussing of current ethical issues in human biology *Coming to Life* is a remarkable journey through developmental biology that reveals miraculous processes in the microscopic world of cells Through an accounting of groundbreaking discoveries Christiane Nusslein Volhard tells us many answers to historical and contemporary questions in science For example she brings us the newest knowledge about embryonic forms explains the genetic mechanisms that influence adult development of all animals and shares insights into the ethical standards society must uphold in the face of new scientific discoveries As the author leads us from laboratory research to its applications in human beings we also come to understand why children look like their parents how an embryonic cell knows to become an eye rather than an eyelash and other incredible influences that result in variety in life Complete with her own hand drawn illustrations *Coming to Life* gives a rare opportunity to understand a Nobel Prize winner's passion for science in concise understandable language 55 b w illustrations *Genetic Mechanism of Development* Frank H. Gene Regulatory Mechanisms in

Development and Evolution: Insights from Echinoderms Charles A. Ettensohn, 2022-01-20 Sea urchins and other echinoderms which have been studied intensively by developmental biologists for more than a century are currently among the most prominent models for elucidating the genomic regulatory processes that control embryogenesis and the evolution of those processes This volume contains reviews from the world's leading researchers who are using echinoderms to address these questions Chapters focus on gene regulatory networks that drive the differentiation and morphogenesis of major embryonic tissues such as the skeleton muscle nervous system immune system pigment cells and germ line and on evolutionary insights from comparative studies of these networks across echinoderms and other taxa Other chapters comprehensively review the architecture and evolution of the cell signaling pathways that establish the early embryonic axes and on recent evolutionary changes in gene networks that have led to dramatic changes in the life history modes of echinoderms This volume provides a comprehensive current picture of exciting research at the interface between developmental genomics and evolution from one of the research communities leading this work Contributions from leading investigators who use echinoderms as model organisms Up to date reviews of developmental gene regulatory networks Current work at the interface between developmental genomics and evolution

Development V.E.A. Russo, 1999-09-06 Studies of organisms have led to a greatly improved

understanding of the genetic mechanisms underlying developmental processes and the epigenetic and environmental influences on these processes This second edition reviews these three levels and their relative importance to give the reader a clear picture of one of the most exciting areas of current biological research *Mechanisms of Life History Evolution*

Thomas Flatt, Andreas Heyland, 2011-05-12 Life history theory seeks to explain the evolution of the major features of life cycles by analyzing the ecological factors that shape age specific schedules of growth reproduction and survival and by investigating the trade offs that constrain the evolution of these traits Although life history theory has made enormous progress in explaining the diversity of life history strategies among species it traditionally ignores the underlying proximate mechanisms This novel book argues that many fundamental problems in life history evolution including the nature of trade offs can only be fully resolved if we begin to integrate information on developmental physiological and genetic mechanisms into the classical life history framework Each chapter is written by an established or up and coming leader in their respective field they not only represent the state of the art but also offer fresh perspectives for future research The text is divided into 7 sections that cover basic concepts Part 1 the mechanisms that affect different parts of the life cycle growth development and maturation reproduction and aging and somatic maintenance Parts 2 4 life history plasticity Part 5 life history integration and trade offs Part 6 and concludes with a synthesis chapter written by a prominent leader in the field and an editorial postscript Part 7
