Los Alamos National Laboratory is an incredible place It was conceived and born amidst the most desperate of circumstances It attracted some of the most brilliant minds the most innovative entrepreneurs and the most creative tinkerers of that generation Out of that milieu emerged physics and engineering that beforehand was either unimagined or thought to be fantasy One of the fields essentially invented during those years was the science of precision high explosives Before 1942 explosives were used in munitions and commercial pursuits that demanded proper chemistry and conformation for the necessary effect but little else The needs and requirements of the Manhattan project were of a much more precise and specific nature Spatial and temporal specifications were reduced from centimeters and milliseconds to micrometers and nanoseconds New theory and computational tools were required along with a raft of new experimental techniques and novel ways of interpreting the results Over the next 40 years the emphasis was on higher energy in smaller packages more precise initiation schemes better and safer formulations and greater accuracy in forecasting performance Researchers from many institutions began working in the emerging and expanding field In the midst of all of the work and progress in precision initiation and scientific study in the early 1960s papers began to appear detailing the first quantitative studies of the transition from degradation to detonation DDT first in cast then in pressed explosives and finally in propellants *Manipulation of Mammalian Development* Ralph B.L. Gwatkin, 2013-11-11 Developmental biology has been transformed recently by discoveries in the fields of molecular biology cell biology and immunology New ways of manipulating mammalian development are uncovering control mechanisms and enabling us to apply them in solving practical problems in animal production and human health This book outlines some of these new manipulations and how they have contributed to the present state of developmental biology Chapter 1 describes gene transfer by micro injection of cloned recombinant DNA into zygotes Although the factors that affect transformation frequencies and integration sites are still unknown such techniques offer a number of exciting prospects Research models for human disease could be artificially created and desirable characteristics in agricultural animals could be enhanced The theme of cell to cell transfer is continued in Chapters 2 and 3 Chapter 2 describes pronuclear transplantation by Sendai virus induced fusion of the karyoplast with the enucleated embryo Using this procedure it has been demonstrated that both male and female genomes are essential for normal development although the reason for this is not yet understood Chapter 3 describes studies on the fusion of whole oocytes Pottery, Glass & Brass Salesman, 1911 **Micro and Nanomechanics, Volume 5** La Vern Starman, Jennifer Hay, Nikhil Karanjgaokar, 2025-08-08 Micro and Nanomechanics Volume 5 of the Proceedings of the 2016 SEM Annual Conference
